

**IN THE CLAIMS:**

1. **(Currently Amended)** ~~Apparatus (1)~~ An apparatus for nebulising a liquid, in particular for aerosol therapy, of the type apparatus comprising:

a nebulising ampoule (2) provided with at least an one opening (4; ~~5~~) for aspirating and/or expelling air from/to the environment and with a mouthpiece (3) for dispensing a nebulisation of medical product; and

a valve (6) for regulating a flow of air into and/or out of the ampoule (2), said valve (6) being positioned in correspondence with said at least one opening (4; ~~5~~), and comprising a shutter (8) able to move between an operative blocking configuration corresponding to an obstruction of said at least one opening (4; ~~5~~) and an operative configuration of consent to the passage of the flow of air a ring (9) connected to the shutter (8) to anchor it the shutter to a tubular portion (2a) of the ampoule (2), said tubular portion (2a) being positioned in correspondence with the at least one opening (4; ~~5~~) and a plurality of deformable connecting elements (10) between the ring (9) and the shutter (8) to allow said shutter (8) to move from said operative blocking configuration to said operative configuration of consent and vice versa, said movement being directly caused by an inspiration and/or expiration phase by a user, ~~characterised in that the~~ deformable elements (10) are spiral shaped and have a first end fastened peripherally to the shutter (8) and a second end fastened to the ring (9).

2. **(Canceled)**

3. **(Currently Amended)** ~~Apparatus as claimed in~~ The apparatus according to claim 1, ~~characterised in that it comprises~~ further comprising a holed protective element (11) positioned in correspondence with the at least one opening (4;

5) to prevent the introduction of foreign bodies into the ampoule (2), ~~preventing any damage to the valve (6).~~

4. **(Currently Amended)** ~~Apparatus as claimed in~~ The apparatus according to claim 1, characterised in that it comprises further comprising a second shutter (12) to cover ~~an~~ a first opening of the at least one opening (5) of the ampoule (2) necessary to expel to the environment air exhaled by a user, said second shutter (12) being a deformable reed-like body having an end (12a) fastened in correspondence with the first opening (5) and an end (12b) that is free to move away from the first opening (5) to uncover it the first opening at least partially and allow the escape of air.

5. **(Currently Amended)** ~~Apparatus as claimed in~~ The apparatus according to claim 1, characterised in that wherein the valve (6) is associated with a so-called supplementary, ~~or secondary,~~ channel (7) of the nebuliser ampoule (2).
